

# Package ‘shinyjq’

February 23, 2021

**Type** Package

**Title** 'jQuery UI' Interactions and Effects for Shiny

**Version** 0.4.0

**Maintainer** Yang Tang <tang\_yang@outlook.com>

**Description** An extension to shiny that brings interactions and animation effects from 'jQuery UI' library.

**License** MIT + file LICENSE

**Encoding** UTF-8

**LazyData** true

**Depends** R (>= 3.2.0)

**Imports** shiny (>= 0.14.0), htmltools, htmlwidgets, jsonlite

**Suggests** ggplot2, highcharter, knitr, rmarkdown

**URL** <https://github.com/yang-tang/shinyjq>,  
<https://yang-tang.github.io/shinyjq/>

**BugReports** <https://github.com/yang-tang/shinyjq/issues>

**RoxygenNote** 7.1.1

**VignetteBuilder** knitr

**NeedsCompilation** no

**Author** Yang Tang [aut, cre]

**Repository** CRAN

**Date/Publication** 2021-02-23 07:00:02 UTC

Animation_effects	<i>Animation effects.</i>
-------------------	---------------------------

---

## Description

Allow element(s) to show animation effects.

- `jqui_effect()`: Apply an animation effect to matched element(s).
- `jqui_hide()`: Hide the matched element(s) with animation effect.
- `jqui_show()`: Display the matched element(s) with animation effect.
- `jqui_toggle()`: Display or hide the matched element(s) with animation effect.

## Usage

```
jqui_effect(ui, effect, options = NULL, duration = 400, complete = NULL)
```

```
jqui_show(ui, effect, options = NULL, duration = 400, complete = NULL)
```

```
jqui_hide(ui, effect, options = NULL, duration = 400, complete = NULL)
```

```
jqui_toggle(ui, effect, options = NULL, duration = 400, complete = NULL)
```

## Arguments

ui	The target ui element(s) to be manipulated. Can be <ul style="list-style-type: none"> <li>• A string of <code>jQuery_selector</code></li> <li>• A <code>JS()</code> wrapped javascript expression that returns a <code>jQuery object</code>.</li> </ul>
effect	A string indicating which <b>animation effect</b> to use for the transition.
options	A list of effect-specific <b>properties</b> and <b>easing</b> .
duration	A string or number determining how long the animation will run.
complete	A function to call once the animation is complete, called once per matched element.

## Details

These functions are R wrappers of `effect()`, `hide()`, `show()` and `toggle()` from jQuery UI library. They should be used in server of a shiny document.

## Examples

```
## Not run:
# in shiny ui create a plot
plotOutput('foo')

# in shiny server apply a 'bounce' effect to the plot
jquery_effect('#foo', 'bounce')

# in shiny server hide the plot with a 'fold' effect
jquery_hide('#foo', 'fold')

# in shiny server show the plot with a 'blind' effect
jquery_show('#foo', 'blind')

## End(Not run)
```

---

Class\_effects

*Class effects.*

---

## Description

Manipulate specified class(es) to matched elements while animating all style changes.

- `jquery_add_class()`: Add class(es).
- `jquery_remove_class()`: Remove class(es).
- `jquery_switch_class()`: Switch class(es).

## Usage

```
jquery_add_class(
  ui,
  className,
  duration = 400,
  easing = "swing",
  complete = NULL
)
```

```
jquery_remove_class(
  ui,
  className,
  duration = 400,
  easing = "swing",
```

```

    complete = NULL
  )

  jquery_switch_class(
    ui,
    removeClassName,
    addClassName,
    duration = 400,
    easing = "swing",
    complete = NULL
  )

```

### Arguments

ui	The target ui element(s) to be manipulated. Can be <ul style="list-style-type: none"> <li>• A string of <b>jQuery_selector</b></li> <li>• A <b>JS()</b> wrapped javascript expression that returns a <b>jQuery object</b>.</li> </ul>
className	One or more class names (space separated) to be added to or removed from the class attribute of each matched element.
duration	A string or number determining how long the animation will run.
easing	A string indicating which <b>easing</b> function to use for the transition.
complete	A js function to call once the animation is complete, called once per matched element.
removeClassName	One or more class names (space separated) to be removed from the class attribute of each matched element.
addClassName	One or more class names (space separated) to be added to the class attribute of each matched element.

### Details

These functions are the R wrappers of **addClass()**, **removeClass()** and **switchClass()** from jQuery UI library. They should be used in server of a shiny app.

### Examples

```

## Not run:
# in shiny ui create a span
tags$span(id = 'foo', 'class animation demo')

# in shiny server add class 'lead' to the span
jquery_add_class('#foo', className = 'lead')

## End(Not run)

```

---

draggableModalDialog *Create a draggable modal dialog UI*

---

**Description**

This creates the UI for a modal dialog similar to [shiny::modalDialog](#) except its content is draggable.

**Usage**

```
draggableModalDialog(
  ...,
  title = NULL,
  footer = shiny::modalButton("Dismiss"),
  size = c("m", "s", "l"),
  easyClose = FALSE,
  fade = TRUE
)
```

**Arguments**

...	UI elements for the body of the modal dialog box.
title	An optional title for the dialog.
footer	UI for footer. Use NULL for no footer.
size	One of "s" for small, "m" (the default) for medium, or "l" for large.
easyClose	If TRUE, the modal dialog can be dismissed by clicking outside the dialog box, or be pressing the Escape key. If FALSE (the default), the modal dialog can't be dismissed in those ways; instead it must be dismissed by clicking on a modalButton(), or from a call to <a href="#">removeModal()</a> on the server.
fade	If FALSE, the modal dialog will have no fade-in animation (it will simply appear rather than fade in to view).

**Value**

A modified shiny modal dialog UI with its content draggable.

---

get\_jqui\_effects *Get available animation effects.*

---

**Description**

Use this function to get all animation effects in jQuery UI.

**Usage**

```
get_jqui_effects()
```

**Value**

A character vector of effect names

---

Interactions

*Mouse interactions*

---

**Description**

Attach mouse-based interactions to shiny html tags, shiny input/output widgets or static htmlwidgets and provide ways to manipulate them. The interactions include:

- **draggable**: Allow elements to be moved using the mouse.
- **droppable**: Create targets for draggable elements.
- **resizable**: Change the size of an element using the mouse.
- **selectable**: Use the mouse to select elements, individually or in a group.
- **sortable**: Reorder elements in a list or grid using the mouse.

**Usage**

```
jquery_draggable(  
  ui,  
  operation = c("enable", "disable", "destroy", "save", "load"),  
  options = NULL  
)  
  
jquery_droppable(  
  ui,  
  operation = c("enable", "disable", "destroy", "save", "load"),  
  options = NULL  
)  
  
jquery_resizable(  
  ui,  
  operation = c("enable", "disable", "destroy", "save", "load"),  
  options = NULL  
)  
  
jquery_selectable(  
  ui,  
  operation = c("enable", "disable", "destroy", "save", "load"),  
  options = NULL  
)  
  
jquery_sortable(  
  ui,  
  operation = c("enable", "disable", "destroy", "save", "load"),  
  options = NULL  
)
```

**Arguments**

ui	The target ui element(s) to be manipulated. Can be <ul style="list-style-type: none"> <li>• A shiny.tag or shiny.tag.list object</li> <li>• A static htmlwidget object</li> <li>• A string of <code>jQuery_selector</code></li> <li>• A JS() wrapped javascript expression that returns a <code>jQuery object</code>.</li> </ul>
operation	A string to determine how to manipulate the mouse interaction. Can be one of enable, disable, destroy, save and load. Ignored when ui is a shiny.tag or shiny.tag.list object. See Details.
options	A list of <code>interaction_specific_options</code> . Ignored when operation is set as destroy. This parameter also accept a shiny option that controls the shiny input value returned from the element. See Details.

**Details**

The first parameter ui determines the target ui and working mode. If the target ui is a shiny.tag (e.g., shiny inputs/outputs or ui created by `tags`) or a shiny.tag.list (by `tagList()`) object or a static htmlwidget, the functions return the a modified ui object with interaction effects attached. When a `jQuery_selector` or a javascript expression is provided as the ui parameter, the functions first use it to locate the target ui element(s) in shiny app, and then attach or manipulate the interactions. Therefore, you can use the first way in ui of a shiny app to created elements with interaction effects (the ui mode), or use the second way in server to manipulate the interactions (the server mode).

The operation parameter is valid only in server mode. It determines how to manipulate the interaction, which includes:

- enable: Attach the corresponding mouse interaction to the target(s).
- disable: Attach the interaction if not and disable it at once (only set the options).
- destroy: Destroy the interaction.
- save: Attach the interaction if not and save the current interaction state.
- load: Attach the interaction if not and restore the target(s) to the last saved interaction state.

With mouse interactions attached, the corresponding interaction states, e.g. position of draggable, size of resizable, selected of selectable and order of sortable, will be send to server side in the form of `input$<id>_<state>`. The default values can be overridden by setting the shiny option in the options parameter. Please see the vignette Introduction to shinyjquery for more details.

**Value**

The same object passed in the ui parameter

**Examples**

```
library(shiny)
library(highcharter)

## used in ui
jquery_resizable(actionButton('btn', 'Button'))
```

```

jquery_draggable(plotOutput('plot', width = '400px', height = '400px'),
  options = list(axis = 'x'))
jquery_selectable(
  div(
    id = 'sel_plots',
    highchartOutput('highchart', width = '300px'),
    plotOutput('ggplot', width = '300px')
  ),
  options = list(
    classes = list(`ui-selected` = 'ui-state-highlight')
  )
)
jquery_sortable(tags$sul(
  id = 'lst',
  tags$li('A'),
  tags$li('B'),
  tags$li('C')
))

## used in server
## Not run:
jquery_draggable('#foo', options = list(grid = c(80, 80)))
jquery_droppable('.foo', operation = "enable")

## End(Not run)

## use shiny input
if (interactive()) {
  shinyApp(
    server = function(input, output) {
      output$foo <- renderHighchart({
        hchart(mtcars, "scatter", hcaes(x = cyl, y = mpg))
      })
      output$position <- renderPrint({
        print(input$foo_position)
      })
    },
    ui = fluidPage(
      verbatimTextOutput('position'),
      jquery_draggable(highchartOutput('foo', width = '200px', height = '200px'))
    )
  )
}

## custom shiny input
func <- JS('function(event, ui){return $(event.target).offset();}')
options <- list(
  shiny = list(
    abs_position = list(
      dragcreate = func, # send returned value back to shiny when interaction is created.
      drag = func # send returned value to shiny when dragging.
    )
  )
)

```

```
)  
jq_draggable(highchartOutput('foo', width = '200px', height = '200px'),  
             options = options)
```

---

jq_bookmarking	<i>Enable bookmarking state of mouse interactions</i>
----------------	---

---

### Description

Enable shiny `bookmarking_state` of mouse interactions. By calling this function in server, the elements' position, size, selection state and sorting state changed by mouse operations can be saved and restored through an URL.

### Usage

```
jq_bookmarking()
```

---

jq_icon	<i>Create a jQuery UI icon</i>
---------	--------------------------------

---

### Description

Create an jQuery UI pre-defined icon. For lists of available icons, see <https://api.jqueryui.com/theming/icons/>.

### Usage

```
jq_icon(name)
```

### Arguments

name	Class name of icon. The "ui-icon-" prefix can be omitted (i.e. use "ui-icon-flag" or "flag" to display a flag icon)
------	---

### Value

An icon element

**Examples**

```
jq_ icon('caret-1-n')

library(shiny)

# add an icon to an actionButton
actionButton('button', 'Button', icon = jq_ icon('refresh'))

# add an icon to a tabPanel
tabPanel('Help', icon = jq_ icon('help'))
```

jq\_ position

*Position an element relative to another***Description**

Wrapper of the jQuery UI `.position()` method, allows you to position an element relative to the window, document, another element, or the cursor/mouse, without worrying about offset parents.

**Usage**

```
jq_ position(
  ui,
  my = "center",
  at = "center",
  of,
  collision = "flip",
  within = JS("$.$(window)")
)
```

**Arguments**

- |    |  |
|----|--|
| ui | Which element to be positioned. Can be a string of <code>jQuery_selector</code> or a <code>JS()</code> wrapped javascript expression that returns a <code>jQuery object</code> . Only the first matching element will be used.   |
| my | String. Defines which position <b>on the element being positioned</b> to align with the target element: "horizontal vertical" alignment. A single value such as "right" will be normalized to "right center", "top" will be normalized to "center top" (following CSS convention). Acceptable horizontal values: "left", "center", "right". Acceptable vertical values: "top", "center", "bottom". Example: "left top" or "center center". Each dimension can also contain offsets, in pixels or percent, e.g., "right+10 top-25%". Percentage offsets are relative to the element being positioned. |
| at | String. Defines which position <b>on the target element</b> to align the positioned element against: "horizontal vertical" alignment. See the my option for full details on possible values. Percentage offsets are relative to the target element.  |

of	Which element to position against. Can be a string of <code>jQuery_selector</code> or a <code>JS()</code> wrapped javascript expression that returns a <code>jQuery object</code> . Only the first matching element will be used.
collision	String. When the positioned element overflows the window in some direction, move it to an alternative position. Similar to <code>my</code> and <code>at</code> , this accepts a single value or a pair for horizontal/vertical, e.g., "flip", "fit", "fit flip", "fit none". <ul style="list-style-type: none"> <li>"flip": Flips the element to the opposite side of the target and the collision detection is run again to see if it will fit. Whichever side allows more of the element to be visible will be used.</li> <li>"fit": Shift the element away from the edge of the window.</li> <li>"flipfit": First applies the flip logic, placing the element on whichever side allows more of the element to be visible. Then the fit logic is applied to ensure as much of the element is visible as possible.</li> <li>"none": Does not apply any collision detection.</li> </ul>
within	Element to position within, affecting collision detection. Can be a string of <code>jQuery_selector</code> or a <code>JS()</code> wrapped javascript expression that returns a <code>jQuery object</code> . Only the first matching element will be used.

---

orderInput

*Create a shiny input control to show the order of a set of items*

---

## Description

Display a set of items whose order can be changed by drag and drop inside or between `orderInput(s)`. The item order is send back to server in the from of `input$inputId`.

## Usage

```
orderInput(
  inputId,
  label,
  items,
  as_source = FALSE,
  connect = NULL,
  item_class = c("default", "primary", "success", "info", "warning", "danger"),
  placeholder = NULL,
  width = "500px",
  legacy = FALSE,
  ...
)
```

## Arguments

<code>inputId</code>	The input slot that will be used to access the current order of items.
<code>label</code>	Display label for the control, or <code>NULL</code> for no label.

items	Items to display, can be a list, an atomic vector or a factor. For list or atomic vector, if named, the names are displayed and the order is given in values. For factor, values are displayed and the order is given in levels
as_source	A boolean value to determine whether the orderInput is set as source mode. Only works if the connect argument was set.
connect	Optional. Allow items to be dragged between orderInputs. Should be a vector of inputId(s) of other orderInput(s) that the items from this orderInput should be connected to.
item_class	One of the <a href="#">Bootstrap color utility classes</a> to apply to each item.
placeholder	A character string to show when there is no item left in the orderInput.
width	The width of the input, e.g. '400px', or '100\ <a href="#">shiny::validateCssUnit</a> .
legacy	A boolean value. Whether to use the old version of the orderInput function.
...	Arguments passed to <code>shiny::tags\$div</code> which is used to build the container of the orderInput.

## Details

orderInputs can work in either connected mode or stand-alone mode. In stand-alone mode, items can only be drag and drop inside the input control. In connected mode, items to be dragged between orderInputs, which is controlled by the connect parameter. This is a one-way relationship. If user want the items to be connected in both directions, the connect parameter must be set on both orderInputs.

When in connected mode, orderInput can be set as source-only through the as\_source parameter. The items in a "source" orderInput can only be copied, instead of moved, to other connected non-source orderInput(s). From shinyjqui v0.4.0, A "source" orderInput will become a "recycle bin" for items from other orderInputs as well. This means, if you want to delete an item, you can drag and drop it into a "source" orderInput. This feature can be disabled by setting the options of non-source orderInput(s) as `list(helper = "clone")`.

From shinyjqui v0.4.0 and above, the orderInput function was implemented in the similar way as other classical shiny inputs, which brought two changes:

1. The input value was changed from `input$inputId_order` to `input$inputId`;
2. The new version supports [updateOrderInput](#) function which works in the same way as other shiny input updater functions. To keep the backward compatibility, a legacy argument was provided if user wanted to use the old version.

## Value

An orderInput control that can be added to a UI definition.

## Examples

```
orderInput('items1', 'Items1', items = month.abb, item_class = 'info')

## build connections between orderInputs
orderInput('items2', 'Items2 (can be moved to Items1 and Items4)', items = month.abb,
          connect = c('items1', 'items4'), item_class = 'primary')
```

```
## build connections in source mode
orderInput('items3', 'Items3 (can be copied to Items2 and Items4)', items = month.abb,
           as_source = TRUE, connect = c('items2', 'items4'), item_class = 'success')

## show placeholder
orderInput('items4', 'Items4 (can be moved to Items2)', items = NULL, connect = 'items2',
           placeholder = 'Drag items here...')
```

---

selectableTableOutput *Create a table output element with selectable rows or cells*

---

### Description

Render a standard HTML table with its rows or cells selectable. The server will receive the index of selected rows or cells stored in `input$<outputId>_selected`.

### Usage

```
selectableTableOutput(outputId, selection_mode = c("row", "cell"))
```

### Arguments

`outputId` output variable to read the table from

`selection_mode` one of "row" or "cell" to define either entire row or individual cell can be selected.

### Details

Use mouse click to select single target, lasso (mouse dragging) to select multiple targets, and Ctrl + click to add or remove selection. In row selection mode, `input$<outputId>_selected` will receive the selected row index in the form of numeric vector. In cell selection mode, `input$<outputId>_selected` will receive a dataframe with rows and columns index of each selected cells.

### Value

A table output element that can be included in a panel

### See Also

[shiny::tableOutput](#), [sortableTableOutput](#)

**Examples**

```
## Only run this example in interactive R sessions
if (interactive()) {
  shinyApp(
    ui = fluidPage(
      verbatimTextOutput("selected"),
      selectableTableOutput("tbl")
    ),
    server = function(input, output) {
      output$selected <- renderPrint({input$tbl_selected})
      output$tbl <- renderTable(mtcars, rownames = TRUE)
    }
  )
}
```

---

 sortableCheckboxGroupInput

*Create a Checkbox Group Input Control with Sortable Choices*

---

**Description**

Render a group of checkboxes with multiple choices toggleable. The choices are also sortable by drag and drop. In addition to the selected values stored in `input$<inputId>`, the server will also receive the order of choices in `input$<inputId>_order`.

**Usage**

```
sortableCheckboxGroupInput(
  inputId,
  label,
  choices = NULL,
  selected = NULL,
  inline = FALSE,
  width = NULL,
  choiceNames = NULL,
  choiceValues = NULL
)
```

**Arguments**

<code>inputId</code>	The input slot that will be used to access the value.
<code>label</code>	Display label for the control, or NULL for no label.
<code>choices</code>	List of values to show checkboxes for. If elements of the list are named then that name rather than the value is displayed to the user. If this argument is provided, then <code>choiceNames</code> and <code>choiceValues</code> must not be provided, and vice-versa. The values should be strings; other types (such as logicals and numbers) will be coerced to strings.

selected	The values that should be initially selected, if any.
inline	If TRUE, render the choices inline (i.e. horizontally)
width	The width of the input, e.g. '400px', or '100%'; see <a href="#">validateCssUnit()</a> .
choiceNames	List of names and values, respectively, that are displayed to the user in the app and correspond to the each choice (for this reason, choiceNames and choiceValues must have the same length). If either of these arguments is provided, then the other <i>must</i> be provided and choices <i>must not</i> be provided. The advantage of using both of these over a named list for choices is that choiceNames allows any type of UI object to be passed through (tag objects, icons, HTML code, ...), instead of just simple text. See Examples.
choiceValues	List of names and values, respectively, that are displayed to the user in the app and correspond to the each choice (for this reason, choiceNames and choiceValues must have the same length). If either of these arguments is provided, then the other <i>must</i> be provided and choices <i>must not</i> be provided. The advantage of using both of these over a named list for choices is that choiceNames allows any type of UI object to be passed through (tag objects, icons, HTML code, ...), instead of just simple text. See Examples.

## Value

A list of HTML elements that can be added to a UI definition

## See Also

[shiny::checkboxGroupInput](#), [sortableRadioButtons\(\)](#), [sortableTableOutput\(\)](#), [sortableTabsetPanel\(\)](#)

## Examples

```
## Only run this example in interactive R sessions
if (interactive()) {
  shinyApp(
    ui = fluidPage(
      sortableCheckboxGroupInput("foo", "SortableCheckboxGroupInput",
                                choices = month.abb),
      verbatimTextOutput("order")
    ),
    server = function(input, output) {
      output$order <- renderPrint({input$foo_order})
    }
  )
}
```

---

 sortableRadioButtons *Create radio buttons with sortable choices*

---

### Description

Create a set of radio buttons used to select an item from a list. The choices are sortable by drag and drop. In addition to the selected values stored in `input$<inputId>`, the server will also receive the order of choices in `input$<inputId>_order`.

### Usage

```
sortableRadioButtons(
  inputId,
  label,
  choices = NULL,
  selected = NULL,
  inline = FALSE,
  width = NULL,
  choiceNames = NULL,
  choiceValues = NULL
)
```

### Arguments

<code>inputId</code>	The input slot that will be used to access the value.
<code>label</code>	Display label for the control, or <code>NULL</code> for no label.
<code>choices</code>	List of values to select from (if elements of the list are named then that name rather than the value is displayed to the user). If this argument is provided, then <code>choiceNames</code> and <code>choiceValues</code> must not be provided, and vice-versa. The values should be strings; other types (such as logicals and numbers) will be coerced to strings.
<code>selected</code>	The initially selected value. If not specified, then it defaults to the first item in <code>choices</code> . To start with no items selected, use <code>character(0)</code> .
<code>inline</code>	If <code>TRUE</code> , render the choices inline (i.e. horizontally)
<code>width</code>	The width of the input, e.g. <code>'400px'</code> , or <code>'100%'</code> ; see <a href="#">validateCssUnit()</a> .
<code>choiceNames</code>	List of names and values, respectively, that are displayed to the user in the app and correspond to the each choice (for this reason, <code>choiceNames</code> and <code>choiceValues</code> must have the same length). If either of these arguments is provided, then the other <i>must</i> be provided and <code>choices</code> <i>must not</i> be provided. The advantage of using both of these over a named list for choices is that <code>choiceNames</code> allows any type of UI object to be passed through (tag objects, icons, HTML code, ...), instead of just simple text. See Examples.
<code>choiceValues</code>	List of names and values, respectively, that are displayed to the user in the app and correspond to the each choice (for this reason, <code>choiceNames</code> and <code>choiceValues</code> must have the same length). If either of these arguments is provided, then the

other *must* be provided and choices *must not* be provided. The advantage of using both of these over a named list for choices is that choiceNames allows any type of UI object to be passed through (tag objects, icons, HTML code, ...), instead of just simple text. See Examples.

**Value**

A set of radio buttons that can be added to a UI definition.

**See Also**

[shiny::radioButtons](#), [sortableCheckboxGroupInput](#), [sortableTableOutput](#), [sortableTabsetPanel](#)

**Examples**

```
## Only run this example in interactive R sessions
if (interactive()) {
  shinyApp(
    ui = fluidPage(
      sortableRadioButtons("foo", "SortableRadioButtons",
                          choices = month.abb),
      verbatimTextOutput("order")
    ),
    server = function(input, output) {
      output$order <- renderPrint({input$foo_order})
    }
  )
}
```

---

sortableTableOutput    *Create a table output element with sortable rows*

---

**Description**

Render a standard HTML table with table rows sortable by drag and drop. The order of table rows is recorded in input\$<outputId>\_order.

**Usage**

```
sortableTableOutput(outputId)
```

**Arguments**

outputId            output variable to read the table from

**Value**

A table output element that can be included in a panel

**See Also**

[shiny::tableOutput](#), [sortableRadioButtons](#), [sortableCheckboxGroupInput](#), [sortableTabsetPanel](#), [selectableTableOutput](#)

**Examples**

```
## Only run this example in interactive R sessions
if (interactive()) {
  shinyApp(
    ui = fluidPage(
      verbatimTextOutput("rows"),
      sortableTableOutput("tbl")
    ),
    server = function(input, output) {
      output$rows <- renderPrint({input$tbl_row_index})
      output$tbl <- renderTable(mtcars, rownames = TRUE)
    }
  )
}
```

---

sortableTabsetPanel    *Create a tabset panel with sortable tabs*

---

**Description**

Create a tabset that contains [shiny::tabPanel](#) elements. The tabs are sortable by drag and drop. In addition to the activated tab title stored in `input$<id>`, the server will also receive the order of tabs in `input$<id>_order`.

**Usage**

```
sortableTabsetPanel(
  ...,
  id = NULL,
  selected = NULL,
  type = c("tabs", "pills"),
  position = NULL
)
```

**Arguments**

...	<a href="#">tabPanel()</a> elements to include in the tabset
id	If provided, you can use <code>input\$id</code> in your server logic to determine which of the current tabs is active. The value will correspond to the value argument that is passed to <a href="#">tabPanel()</a> .
selected	The value (or, if none was supplied, the title) of the tab that should be selected by default. If NULL, the first tab will be selected.

type	"tabs" Standard tab look "pills" Selected tabs use the background fill color "hidden" Hides the selectable tabs. Use type = "hidden" in conjunction with <a href="#">tabPanelBody()</a> and <a href="#">updateTabsetPanel()</a> to control the active tab via other input controls. (See example below)
position	This argument is deprecated; it has been discontinued in Bootstrap 3.

**Value**

A tabset that can be passed to [shiny::mainPanel](#)

**See Also**

[shiny::tabsetPanel](#), [sortableRadioButtons](#), [sortableCheckboxGroupInput](#), [sortableTableOutput](#)

**Examples**

```
## Only run this example in interactive R sessions
if (interactive()) {
  shinyApp(
    ui = fluidPage(
      sortableTabsetPanel(
        id = "tabs",
        tabPanel(title = "A", "AAA"),
        tabPanel(title = "B", "BBB"),
        tabPanel(title = "C", "CCC")
      ),
      verbatimTextOutput("order")
    ),
    server = function(input, output) {
      output$order <- renderPrint({input$tabs_order})
    }
  )
}
```

---

updateOrderInput	<i>Change the value of an orderInput on the client</i>
------------------	--

---

**Description**

Similar to the input updater functions of shiny package, this function send a message to the client, telling it to change the settings of an [orderInput](#) object. Any arguments with NULL values will be ignored; they will not result in any changes to the input object on the client. The function can't update the "source" orderInputs.

**Usage**

```
updateOrderInput(
  session,
  inputId,
  label = NULL,
  items = NULL,
  connect = NULL,
  item_class = NULL
)
```

**Arguments**

session	The session object passed to function given to shinyServer.
inputId	The input slot that will be used to access the current order of items.
label	Display label for the control, or NULL for no label.
items	Items to display, can be a list, an atomic vector or a factor. For list or atomic vector, if named, the names are displayed and the order is given in values. For factor, values are displayed and the order is given in levels
connect	Optional. Allow items to be dragged between orderInputs. Should be a vector of inputId(s) of other orderInput(s) that the items from this orderInput should be connected to.
item_class	One of the <a href="#">Bootstrap color utility classes</a> to apply to each item.

**Examples**

```
library(shiny)

if (interactive()) {

  ui <- fluidPage(
    orderInput("foo", "foo",
              items = month.abb[1:3],
              item_class = 'info'),
    verbatimTextOutput("order"),
    actionButton("update", "update")
  )

  server <- function(input, output, session) {
    output$order <- renderPrint({input$foo})
    observeEvent(input$update, {
      updateOrderInput(session, "foo",
                       items = month.abb[1:6],
                       item_class = "success")
    })
  }

  shinyApp(ui, server)
}
```
